Javier Urbaneja Benítez 24/10/26

- STAGE 1:

The function that was most difficult for me was "decode()" because it use some knowledge of C and computer systems that I haven't seen in the university (the "|" pipe symbol) or that I hadn't remembered (the "v<<1").

The one that was the ~~(ost)~~ easiest for me was the "tournament()" because it only selects two elements from an array and returns the one that has the biggest fit.

- STAGE 2:

I tested the program with 1, 2, 4 and 8 processes, then I tested it with migration periods of 5, 20 and 100. I measured that increasing the number of processes, I can reduce the number of evaluations needed to reach the maximum, because ~~(here)~~ the program shares more children. Also, I measured that increasing the migration periods increases the number of evaluations because the program share fewer children.
